The Gladiator® braces were built to offer durable, dependable support to patients of every activity level. By offering varying heights and designs, the Gladiator® series ensures your patients will receive the optimal brace for protection and support of ligament injuries and instabilities. Breathable liners laminated with silicone eliminate migration and ensure proper leg positioning for optimal functionality, support and comfort. The Gladiator® OA MAX is ideal for unloading of the medial or lateral compartment for patients suffering from osteoarthritis. In addition to the flexion-extension control offered with all of our Gladiator® orthoses, the Gladiator® OA MAX allows you to control abduction and adduction with a single Allen wrench. The Gladiator® ACL MAX provides stabilization for patients diagnosed with moderate to severe ACL ligament issues. The Gladiator® ACL Lite and ACL PRO offer reliable support for moderate to high activity level patients. The Gladiator® ROMPS brings relief to patients with minor ligament issues, patella tracking issues and other patella related diagnoses with horse-shoe padding to keep the patella in place.
